

Robotic Automation Solutions

Collaborative robotics.
Safe teamwork between
humans and machines.

Your new robotic colleague. Safe. Precise. Collaborative.

Automation does not make people obsolete. The tendency towards a large mix of components and flexible small series production actually requires more frequent human intervention. This makes safe human-machine collaboration (HMC) all the more important. The human hand and the robotic arm's grabber must be able to work safely next to and with one another. Collaborative

robotics brings out the best in both human and machine. It combines human intuition, creativity and the ability to improvise with the mechanical working speed and repetitive accuracy of their robotic colleagues. Do you want to increase your competitiveness? We would be happy to advise you on the various possible applications of collaborative robotics.

Opportunities and advantages

Robotic colleagues are indispensable to the smart factory of Industry 4.0.

- » Flexible uses
- » High level of production safety
- » Supports and frees up staff
